

Sending Big Files

From time to time, it may be necessary for you to send someone a really big file. How big is big? Well, that depends on the restrictions of your internet provider or email program. But a good number might be a file larger than 10 mb.

Some email systems don't allow big attachments to be sent or received (we found that out working on Era Fashions articles.) We came up with a way to send the files without having to use our email programs to either send or receive the file(s).

There are several ways to do this - you've probably heard of iCloud, Dropbox, etc. Those are good solutions in some cases, but they require setup and invitations and signups that I prefer to avoid. And not all of these are free. And not all of them work on both the PC and Mac platform.

The method we've found that's quick and easy to do this is www.WeTransfer.com and it's free to boot. You don't need to sign up either. And it works the same on PCs and Macs. Here are the 6 simple steps:

- Go to <http://www.WeTransfer.com>
- Click on the box to add files you'd like to transfer (up to 2 gigabytes!)
- then enter the email address of those you'd like to receive the files
- Type in your email address
- Optionally add a message to your recipients to tell them what you're doing
- Click on TRANSFER.

While you might not need to do this right now, keep this in the back of your head (and filed on your computer) so that if you ever need to do it, you'll have your notes to refresh your memory.
